ANNUAL MEDICAL

AND

SANITARY REPORT

1931.

KINGSTOWN:

PRINTED AT THE GOVERNMENT PRINTING OFFICE.

1932.

Digitized by the Internet Archive in 2019 with funding from Wellcome Library

CHIEF MEDICAL OFFICER'S OFFICE,

Kingstown,

7th April, 1932.

Sir,

I have the honour to submit for the information of Your Honour and His Excellency the Governor and for transmission to the Right Honourable the Secretary of State, the Medical Report on the Health and Sanitary Conditions of St. Vincent for the year 1931 with the returns etc., appended thereto.

I have, etc.,

STANLEY BRANCH, Chief Medical & Health Officer.

His Honour
THE ADMINISTRATOR.
(501/1932).

REPORT OF THE MEDICAL DEPARTMENT FOR THE YEAR ENDING 31st DECEMBER, 1931.

I. Administration.

(a) STAFF.

Dr. Branch, Chief Medical and Health Officer was granted 5 months and 7

days' vacation leave from 1. 7. 31. He left the Colony on 16. 6. 31.

During his absence Dr. Slinger was by direction of His Excellency transferred from District 3 to District 1 and appointed to act as Chief Medical and Health Officer in conjunction with the duties of his substantive post except the attendance at the daily central dispensary which was performed by Dr. Lai Kiow, the Resident Surgeon, who was granted the privilege of private practice in Kingstown.

Dr. Gregory was transferred to District 3.

Dr. Charles, Medical Officer, District 4 was granted 7 days' departmental followed by 14 days' casual leave from 1. 7. 31.

He was transferred by direction of the Administrator to District 2 (South)

on November 1st, and the office filled by Dr. Bonello.

Dr. Stewart, Medical Officer, District 2 (North), gained a well merited promotion to the Trinidad Medical Service. He left the Colony on December 4th.

Dr. Brereton, acting District Medical Officer in the Island of Dominica was selected to act in place of Dr. Stewart. He arrived in the Colony on December 18th and forthwith assumed his duties.

Many and various departmental changes and periods of leave were arranged for among the Junior Staff of Dispensers, Sanitary Inspectors, and District Nurse-Midwives.

(b) Ordinances Affecting the Public Health Enacted During the Year 1931. None.

Four sets of regulations were submitted for Legislative sanction which have not yet been granted:—

- 1. Food Vendors and Food Vending Establishments.
- 2. Bakehouses.
- 3. Sale of Milk.
- 4. Mosquitoes.

(c) Financial.

The Revenue and Expenditure for the years 1930 and 1931 are herewith shewn:—

- 1	1930.		1931.

The allocation of the Expenditure "Sanitary Measures" was arranged under the following sub-heads.

	1930.	1931.
1. Kingstown, Scavenging and Cleaning 2. Small Towns 3. Anti-Mosquito Work 4. Rat Destruction 5. Public and School Latrines 6. Vaccines and Serums (including refrigeration) 7. Disinfection of Premises 8. Rent of Office 9. Miscellaneous (including Publicity and Propaganda) 10. Incinerator Totals	£ s. d. 753 7 7 306 0 8 5 8 9 1 9 9 163 3 10 50 3 7 5 1 4 54 8 4 20 9 2 31 7 4	£ s. d. 795 16 2 311 13 2 14 11 1 1 2 7 61 4 0 101 1 8 9 16 7 50 5 0 16 8 8 24 17 11 1,386 16 10

For the scavenging and cleaning of Kingstown, another mule was purchased

and the stables enlarged. There are now 2 mules, 1 horse and 2 carts.

Increased expenditure was incurred by the purchase of supplies of Typhoid para typhoid vaccine required for mass inoculations during the outbreak of Enteric Fever in the Buccament Valley.

II. Public Health.

1. General Remarks. The sickness recorded in the districts by the various Medical Officers, as well as the numbers treated in the Institutions are shewn in the following table with the corresponding figures for 1930.

		1930.	1931.
Attendances at Dispensaries	•••	$\frac{-}{30,556}$	34,997
Colonial Hospital—In patients	• • •	1,081	1,191
,, Out patient casual	ties	316	304
Casualty Hospitals (2) In patients	• • •	103	73
Pauper, Lunatic and Leper Asylums	• • •	179	184
Totals	•••	32,235	36,749

The attendances at the district dispensaries continue to show considerable increase. The above are exclusive of persons attended by the resident dispensers at Sandy Bay, Bequia and Union Island.

Epidemics of Enteric Fever and Whooping Cough occurred during the year. The number of deaths exclusive of still-births was 899 as compared with 692 in 1930. Deaths of children under 1 year 281; deaths of children from 1 to 5 years 174.

Diarrhœa in children under 2 years of age was prevalent in every district throughout the year. The District Medical Officers report 1,129 cases and there were 104 deaths. In persons over 2 years of age there were 271 with 35 deaths.

The year 1931 was definitely unhealthy. There is an increase in both morbidity and mortality returns, and with a decreased population as shewn by the Census taken on April 26th, 1931. The death rate rises to 21:23 per 1000.

2. Communicable Diseases—

Mosquito or Insect borne.—Malaria.

The District returns show 532 cases with 9 deaths, of which 288 with 7 deaths occurred in District 2 (South). No deaths occurred of cases admitted to Hospital.

Infectious Diseases—Enteric Fever.

83 cases were notified with 17 deaths.

A serious outbreak occurred in the Buccament Valley in District 2 (South) on the Leeward side of the island. The first case was brought into Hospital on the-30th May from the village of Vermont at the head of the Valley. Thereafter, case after case, and all the suspects were brought in; the last arriving on October 28th. Altogether 77 cases with 16 deaths were definitely attributed tothe epidemic, either as permanent residents in the infected area or persons who had spent one or more days in that area before returning to their own homes. In spite of inoculation, one nurse at the Hospital became infected, but I am glad to say, recovered. The case mortality of the Epidemic was 20.5%. The case mortality of this class of infection for the year was 20.48 %. Apart from the Epidemic, only 6 cases were notified throughout the Colony with one death. A labourer died at Vermont on March 27th. He was seen only once by the District Medical Officer a short time before his disease. The death was attributed to Broucho-pneumonia. It is now known that the deceased returned from Curacao, and was taken ill soon after: he remained ill with a fever and diarrhea for several weeks and died with pulmonary symtoms attributed to the cause entered on his death certificate. There does not appear to be any doubt that this was the original source of infection.

Vermont is the village at the top of the Buccament Valley, its sanitation is primitive; latrines are not generally provided by the householders, and when so provided, only occasionally used. The water supply is derived from the river where washing, and the morning and evening toilet is performed, when drawing the water supply. As soon as the rains set in all surface deposits would find

their way into the river.

From the accompanying plan it can be observed that the Buccament River and its tributaries are the only water supply of the Valley, and the numerous

villages along its course depend entirely on this supply.

The roads are only to a limited extent adapted for wheeled or motor traffic. The ambulance is only allowed to go as far as Peniston Works on the Main Highway. Stretchers and other forms of transport had to be requisitioned to

bring the cases from the hillsides to the ambulance.

On July 6th during the height of the Epidemic a sample of river water was sent to Dr. J. L. Pawau, Bacteriologist of Port of Spain, Trinidad, for examination. It was found to contain B. Coli Communis in as small a quantity as 1 c.c. Commenting on the examination, Dr. Pawan wrote "This fact considered in conjunction with the sanitary data supplied by Dr. Slinger, acting Chief Medical and Health Officer condemns the water as unsafe and unfit for human consumption".

On August the 22nd, 2 samples were sent to the Laboratory in Barbados for bacteriological report. In the interval much rain had fallen, much cleaning up had been done by the Sanitary Department, and two communal latrines had been creeted and put into general use. The Barbados anthority reported that the samples were found to be "free of B. Coli Communis or any organism of the

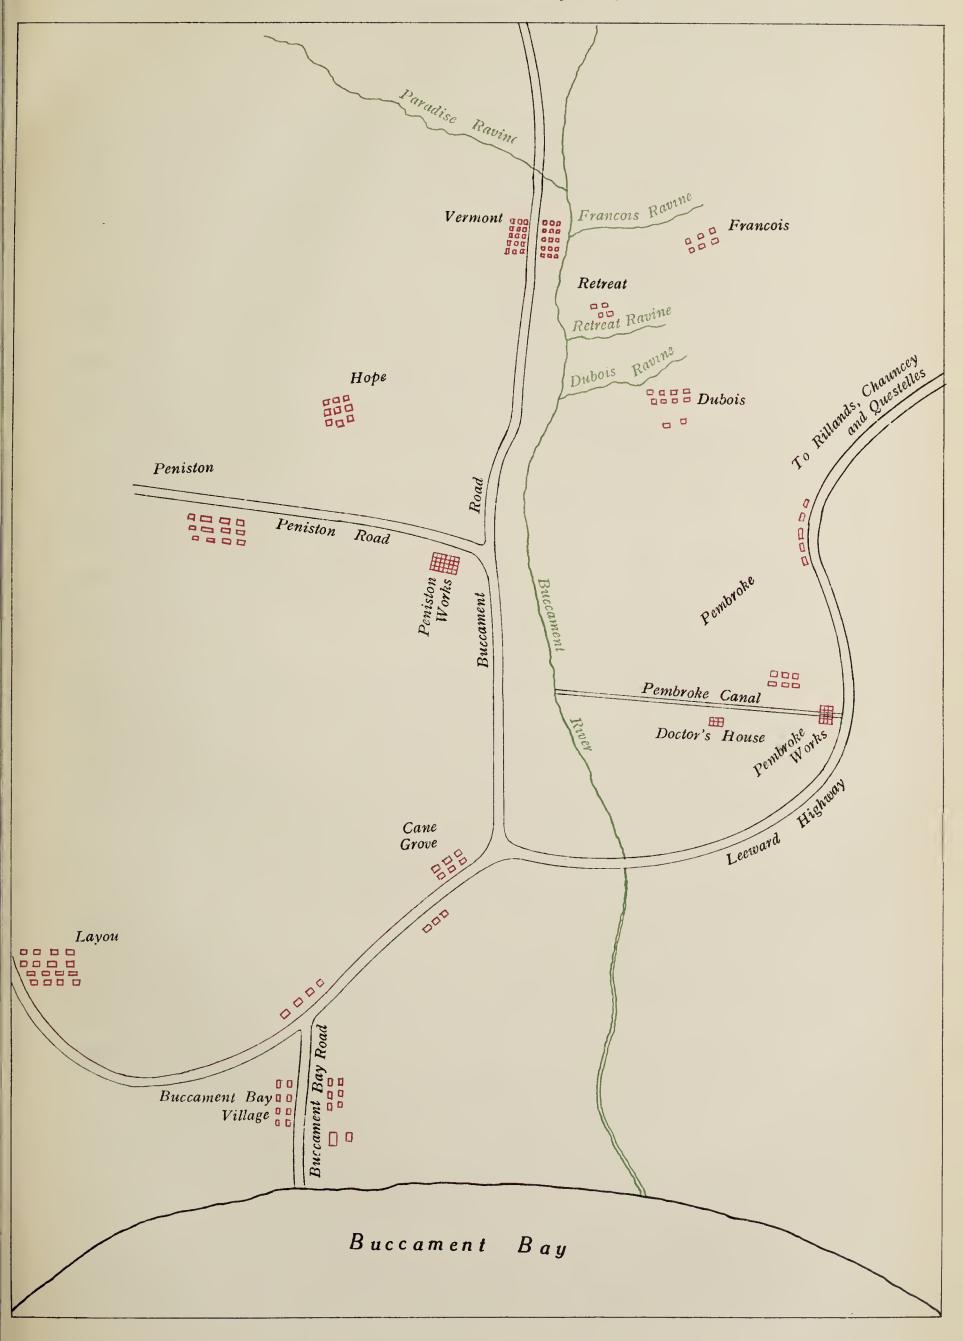

trahoid group"

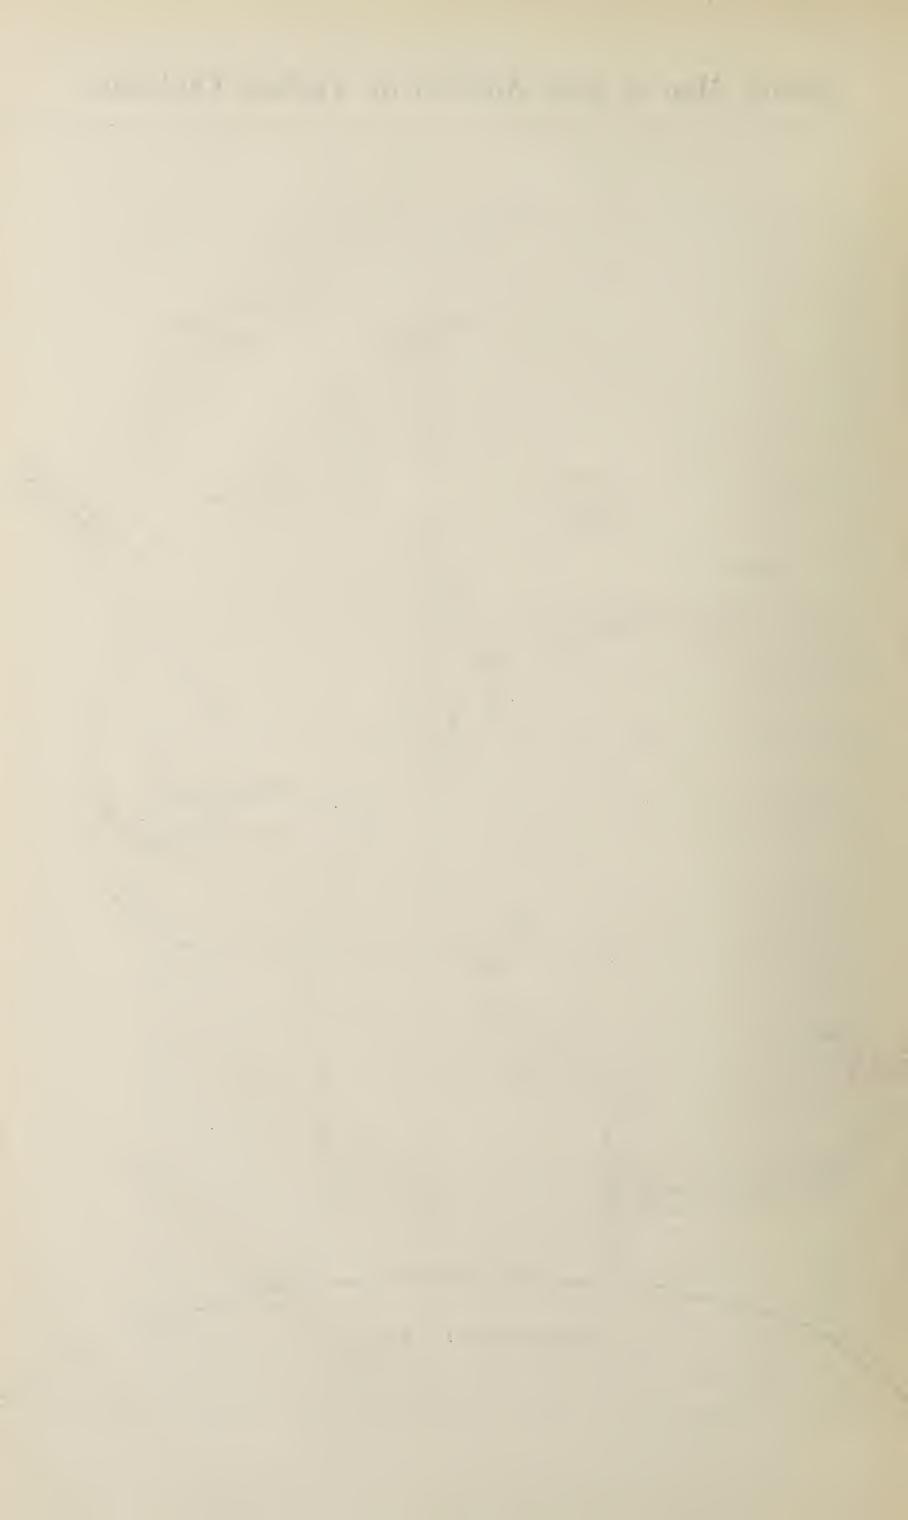

Communal latrines have been erected and are in general use. Wherever possible householders are persuaded to put in their own pit latrines. The villages have been cleaned up and cleared of over and under growth, and there has been a general wave of enthusiasm to have the settlement look cleaner. The habit of

the native has not changed, and the water supply is the same.

I was absent from the Colony during the outbreak. The work done by my successor, the Medical Officer, District 2 (South), the Chief Sanitary Inspector and his staff, the Resident Surgeon, Nurse Matron and Staff at the Colonial Hospital was splendid, and the results amply justified the efforts. 200 cases were rushed by ambulance to the Hospital during the period under review; 119 of these in the month of July. The Hospital was practically evacuated of other patients to accommodate those that were brought in. Eventually the disused building at Low Point was turned into a convalescent ward.

Sketch Map of Area Affected by Typhoid Outbreak.

From the early onset, mass inoculations of contacts and school children and residents in all the villages was carried out. I regret that our local supply of Typhoid para typhoid vaccine was insufficient to meet our requirements; all that could be purchased from the neighbouring islands was secured; but we are particularly grateful to the Government of Trinidad for the liberal gift of 2,100 c.c. made in their own laboratory in Port of Spain. The cases inoculated ran into many thousands and altogether 2,807 c.c. of vaccine were used.

The villages were combed daily by a staff equipped with thermometers; all suspects were removed to Hospital; all encouraged to present themselves for inoculation; houses and premises were disinfected with Izal wherever necessary.

I wish to put on record the thanks of the Medical Department to His Honour the Administrator for his help and advice during a very trying time.

Tuberculosis. 71 cases were notified, 63 of whom were of the pulmonary type. There were 54 deaths of which 53 were pulmonary.

Whooping Cough. An epidemic passed over the Windward side of the island especially Districts 3, 4, and 5. 757 cases were recorded and 22 deaths.

Influenza. Febrile catarrhal infections occurred throughout the year. 1,396 cases were recorded with 30 deaths. The heaviest morbidity and mortality were registered in District 2 (South).

Yaws and Syphilis. In 1930 the recorded injections in the treatment of these conditions numbered 18,383 at a cost of £357. 7. 2. In 1931 the recorded injections amounted to 28,368 at a cost of £200. The increase in the number of injections given and decrease in cost is consequent on the general use of Sobita".

The Medical Officers write favourable comments on the continued use of this preparation. These views have been well expressed by Dr. Slinger, Medical Officer, District 1 whose report I attach hereto.

(i) Therapeutic Value. "The drug is especially valuable in the treatment of Yaws in its early stages. Cases show clinical cure after three or four injections given weekly. I have found it most essential for injections of "Sobita" to be given weekly. Whereas arsenical preparations are only effective if given fortnightly, "Sobita" acts only if given weekly.

In treating the later stages of Yaws "Sobita" is in my opinion distinctly inferior to the arsenicals, but is of considerable value nevertheless.

- (ii) (a) Dosage. Weekly, doses of from 0.5 c.c. to 5.0 c.c. are tolerated. Small children are given 0.5 to 1.0 c.c.; older children 1.0 to 3.0 c.c. and adults 3.0 to 5.0 c.c.
- (b) Method. Most injections are given into the deep subcutaneous tissues of the buttock. The needle is pushed into the muscle and withdrawn until it is felt to clear the muscle and the injection then made.
- (iii) Local effects. A certain number of cases develop marked local reaction followed by induration.

Injection of another dose into an indurated area is very liable to be followed by annoying and persistent hamorrhage from the needle puncture.

Pain caused varies a great deal but is no worse generally, than that caused by Kharsulphan.

- (iv) Toxicity. A few cases of mild stomatitis have been seen. These have resolved readily on cessation of injections Pot. Chlorat. by the month.
- (v) General. It is my opinion that the greatest value of "Sobita" is that it can be supplied in unlimited quantity. All cases presenting can be effered immediate treatment; the moral effect of this is considerable. When the patients have learned that injections must be taken early in the disease and at regular intervals, much more progress will be made".

Vital Statistics.		1930.	1931.
Estimated Population	•••	${53,228}$	47,961 (Census returns).
Births excluding still-births	• • •	1,771	1,852
Birth rate per 1,000	• • •	35.34	41.09
Still-births	• • •	110	119
Percentage of live to still-births	• • •	5.85	6.04
Death rate per 1,000	• • •	15.07	21.23
Deaths of children under 1 year			
(excluding still-births)	• • •	166	281
Mortality per 1,000 births	• • •	94.	152

The estimated population 47,961 is the actual return of the census taken on April 26th, 1931. In 1930 the Registrar's returns estimated the population at 53,228. The Birth and Death rates based on the figures of the last few years are not reliable. I have ventured to make a new start based on the figures of the 1931 Census.

I am entirely responsible for the above classification. It will not be found to agree with the classification made by the Registrar. It has been made as carefully and accurately as circumstances allow. I have had to omit any effort toclassify deaths in the Southern Grenadines as very few are certified by a Medical Officer; they appear to fall under three groups, still, old age, and ill defined.

III. General Measures of Sanitation.

Sewage Disposal. The deep pit with box seat and fly proof cover is the prevailing type of latrine in rural districts. The prejudice against this type as a source of danger to water supplies has now been largely discountenanced.

The modern view is well expressed by B. E. Washburn, Field Director of the International Health Division of the Rockfeller Foundation. "It has been proved, through numerous tests that the germs found in human bowel filth are scattered upon the surface of the ground and not from pits. The fermentation taking place in pits liquefies most of the bowel filth. The soil is an excellent disinfectant, and, as a rule, there need be no fear that springs and streams will be contaminated through percolation from latrine pits".

Sanitary Inspectors had 347 new pit latrines built during the year. In no case is a pit less than 6 ft. deep accepted. Where the depth of the soil permits peasants are encouraged to dig their pits 10 feet deep or more. Latrines constructed by this department for the Primary Schools have pits between 14 ft. and 17 feet deep. Pits are not emptied. When the contents get within 18 inches of the surface of the ground the privies are shifted to new sites and the old pit filled in

The maintenance of latrines in a sanitary condition calls for the unremitting attention of the Sanitary Staff.

The fallacy of putting liquid disinfectants, wood ash, charcoal, white lime and other antiseptics into cesspits for the purpose of "disinfecting" them still prevails to a large extent. Sanitary Inspectors are instructed to advise house-holders to add horse manure to their pits whenever they are offensive and thereby increase bacterial action in the pits instead of destroying the germ life with antiseptics. 252 pit latrines were repaired on instructions from Sanitary Inspectors.

The pail latrine still obtains in Kingstown and in parts of the Small Towns near to the sea. The subsoil water in Kingstown is so near to the surface that no other form of conservancy is possible. We are well aware of the embarrassment that is occasioned to visitors who are not accustomed to this type of latrine. For the present, however, a general sewerage system is not within the range of practical politics.

45 pail latrines were built and 77 repaired.

Septic Tanks. This type of latrine is becoming a feature of the better class house in and around Kingstewn where there is sufficient yard space for laying the subsoil drains. Such tanks were installed in four premises including the new premier hotel of the Colony.

With the lighting of Kingstown by electricity it was feared that careless night soil carriers would prove a fruitful source of nuisance to the public. Thanks however to an appreciation on their part of the changed order of things, and to the enforcement of the regulations, these fears have not been realised.

Public Latrines. There is a public latrine over the sea in each Small Town and three such latrines in Kingstown. They were all maintained in proper repair. The latrines in Kingstown are cleansed and disinfected daily in the early hours of the morning and those in the Small Towns are cleansed twice a week.

As a part of the campaign in stamping out the Typhoid Epidemic in the Buccament Valley, 2 deep pit communal latrines were put up at Vermont Village,

and another at Peniston.

Scarenging and Refuse Disposal. 1,456 tons of house refuse and street sweepings were collected in Kingstown and destroyed by Incineration. The refuse collected amounted to 3,018 cart loads.

In Kingstown a daily house to house collection of refuse is made. Each

householder is required to provide a metal covered dust bin.

In the Small Towns of Georgetown, Layou, Barronallie, Calliaqua and Chateaubelair, 8,623 donkey cart loads of house refuse and street sweepings were removed and partially burnt on the foreshores of the respective Small Towns. Each Small Town is provided with a donkey cart and a permanent scavenging gang.

Drainage. Under the Colonial Development Scheme provision has been made for extensive improvements in the surface drains in Kingstown and the Small Towns.

Work on the drains in Calliaqua, Barrouallie and Georgetown was started towards the end of the year. In Calliaqua barrel-shaped concrete surface drains have already been laid down in the most swampy section. These drains have a

decided effect in improving the living conditions in that area.

The annual flooding to which Georgetown was subjected from storm water from Grand Sable Estate is now a thing of the past. A large concrete drain running along the entire length of the town and cutting it off from the Grand Sable Estate is all but completed. The laying down of this drain is a definite improvement to the Sanitary condition, and to the security of property in the Town.

In Barrouallie a barrel-shaped drain has been laid between Reversion Estate and a section of the Leeward Main Road. Old stone drains are being repaired and crossings and culverts made secure.

Water Supplies. In no department of public health measures has the beneficent effect of the Colonial Development Fund been greater felt than in the provision of Water supplies for new areas, and the improvement of existing supplies. It is now possible to walk from Coull's Hill to Chatcaubelair and meet stand pipes all along the route.

On the Windward side of the Island two new supplies have been laid down. That at Colonarie is drawn from the river above the highest settlement and serves

Park Hill, South Rivers and Friendly Villages.

At Stubbs the supply serves the Villages of Upper and Lower Stubbs and Victoria.

Children attending the Stubbs Government School had formerly to lose between ten and fifteen minutes in going to and from the spring for water. They now have two water taps and a shower bath laid on to the premises.

In Kingstown the Town Board was presented with the spectacle of having a water famine while the rains were falling regularly. Consideration of the question led to the discovery that the air valves on the main line had not been cleaned

for over twenty years. When these were rectified the danger passed,

To the local lay mind the fact that the water supply is pipe borne carries with it a sense of security in its purity. This is a danger. All sources of supply should be carefully protected from trespassers; storage reservoirs and filtration should form a part of every scheme that is laid out.

Clearance of Bush and Overgrowth. There is a gradual appreciation of the harmfulness of overcrowding ones' home with trees. In Kingstown where a breadfruit tree was a feature of nearly every back yard, householders have in many instances, and of their own accord, cleared their premises of quite a number of these trees. In Paul's Lot there has been a marked reduction of both breadfruit trees and banana clumps.

At the instance of Sanitary Inspectors 898 trees were cut down, 1,562 trees

trimmed and 671 premises cleared of bush.

Sanitary Inspections and Work. 59,595 visits of inspection were made; 14,174 notices and verbal orders given; 398 latrines were built and 331 repaired; 6,020 yards and 379 hog swamps were cleaned; 391 drains were cleaned and 115 repaired; 834 accumulations of manure were removed; 173 dust bins were provided by householders and 19 repaired; 168 shops were scrubbed, 216 cobwebbed, 61 lime washed; 24 cake trays were made fly proof; 10 dwelling houses and 8 eaves of gutters were repaired; 120 boats were emptied of stagnant water. 60 premises were disinfected for infectious diseases.

Direct Anti-Mosquito Work involved the oiling of 76 drains and 1,884 pools.

Larvæ were found in \$2 boats and on 777 premises.

Deratisation. Trapping and poisoning were maintained throughout the year. 923 rats were destroyed. The Department uses the "5 inch Jaw Shave Trap" for trapping, and "Rat Nip" for poisoning.

Housing and Town Planning.

Under the provisions of the newly made "Dwelling House Regulations" 192 notices for the erection of dwelling houses were approved. Returns to the

end of the year disclosed that 120 of these bouses had been completed,

In country villages the wattle-and-daub house is the prevailing type. In the absence of jalousies, which the peasant-builder finds difficult to construct, ventilation is provided by allowing an open area of about six inches between the top of the sides and the eaves. The overhanging thatch keeps out the rain.

The proposal to build peasants' houses at Chateanbelair with funds provided by the Colonial Development Fund is still under consideration. A cottage 20 feet by 10 feet built of concrete, representing the type of house intended to be built

was erected during the latter part of the year.

Labour Conditions.

Comparatively speaking, the general world depression has touched but

lightly the living conditions of the labouring classes.

This relative immunity from privation might be attributed to the growing of their own food (including the famous breadfruit) on their holdings or on the mountain lands of the estates. The expenditure of Colonial Development Funds has afforded employment on the roads and on other constructional work throughout the year.

This Colony prefers a system of short to one of standing crops. There are no cocoa, cocoanut or spice trees to be cut down when these crops are unremunera-

tive. While the estate owner in some of the other islands, remains in a state of indecision whether he should destroy a eocoa estate on which he was losing money, but which had sustained him and his forbears formerly, the local proprietor changes his crops from cotton to arrowroot or from arrowroot to sugar cane, or adopts a mixed cultivation with a facility which the system of standing crops does not permit. Money is scarce but there is no evidence of actual want.

Food in relation to Health.

Bread. It is pleasing to note that a pious hope expressed in 1928 received

fulfilment during the period under review.

In the 1928 report the observation was made that "in some of the larger countries the insistent demand of the public for 'clean bread' has resulted in the disappearance of the hand made article in favour of the machine made product—the loaf in some eases leaving the machine wrapped in paper or put up in bags. Now that there is a likelihood of electric power becoming available in Kingstown, who knows, but that some enterprising business man may one day confer this boon upon the island." That the public have so regarded it is evidenced by the ready patronage that has been accorded the "Sanitary Bakery" which opened its doors in November.

This bakery, carried on in commodious, well lighted and ventilated premises, is provided with two electrically driven dough mixers and a cutting machine. The process of bread and eake making is as satisfactory as one could wish.

The standard of cleanliness in the other bakeries was well maintained; many of them however, suffer from structural defects which can be remedied only at great cost.

There were 46 licensed bakeries and 76 registered bakers.

Meat. The animals slaughtered in the Kingstown abattoir included 573 cattle, 298 pigs, 143 goats, and 198 sheep. No animals are imported for slaughter.

Milk. Licensed milk vendors and dairymen numbered 254. Routine milk testing was carried on throughout the year. Anyone wanting to have a sample of milk tested can bring it to the Department and have it done. There were two convictions for selling adulterated milk.

Retail Shops, etc. Registered premises other than "Bakehouses" engaged in the preparation and sale of food included 204 retail shops, 17 parlours, 15 aerated water factories and 8 cook shops.

1,034 medical certificates were issued to persons engaged on these premises.

Unsound Food. Articles of food seized and condemned as unfit for human consumption included a half cask of salted herrings.

School Hygiene.

The District Medical Officers paid 98 quarterly inspection to the various primary schools; 438 pupils were recommended for treatment for yaws, ulcers and skin diseases. There is not at present the personnel nor the facilities for a fully fledged scheme of School Medical Inspection including dental treatment.

The Sanitary Department is wholly responsible for the erection and main-

tenance of the School Latrines.

During 1931 the following new latrines were erected:-

£17 7 3 1. Paget Farm, Bequia, Anglican 3 compartments, 3 pails Free transport was provided by the Government Sloop " Carib" 12 17 8 Questelles Government 2. 2 compartments, privy eesspit. 13 Evesham Wesleyan . . . 3 compartments, privy cesspit. 6 2 **建43** Carried forward

Measures taken to spread the knowledge of Hygiene and Sanitation.

Sanitary Inspectors are encouraged to invite discussions of sanitary problems during periods of house to house inspection, and on occasions of special visits to carry out concurrent and terminal disinfection of premises. This is thought to be productive of good results. At any rate it has led to an increased number of

complaints of nuisances by private householders.

The "Dwelling House Regulation" passed in October 1930 has brought the Sanitary Department into closer touch with the people. Under the provisions of this regulation anyone wanting to build a house has to get in touch with the District Sanitary Inspector who helps the applicant to fill in the necessary form. The Inspector has also to go to the proposed site and measure the land, etc. These occasions never fail to produce opportunities for friendly discussions on health matters.

The Chief Sanitary Inspector gave lectures at several schools and to a body of school teachers. Lantern lectures were given at the Layou "Sun Ray" Cluband on Victoria Park, Kingstown.

Training of Sanitary Personnel. Owing to the necessity of concentrating the efforts of the Department on stamping out the outbreak of Enteric Fever the annual course of lectures and demonstrations to persons intending to qualify as Sanitary Inspectors was not started till the month of September. The course was still being carried on at the end of the year.

Prosecutions. For various breaches of the Public Health Ordinances 106

complaints were laid; 13 were withdrawn; 90 were convicted.

The fines imposed amounted to £15. 19. 0.

I desire to express my thanks to the Chief Sanitary Inspector for his work and the help I have received from him during the year. I am also indebted to him for copious notes and tables prepared for me for this section of the report.

Notes on Still-born Babies.

Of the 32 cases, 12 were macerated.

Of the remaining 20.

1. Congenitally malformed.

2. Mother jaundiced and suffering from malaria.

3 & 4. Transverse presentations.

5 & 6. Mothers eelamptic. 7-11. Prolonged labours.

12-13. Difficult labour—forceps delivery.

14-15. Premature at 6 months. History of a fall.

16-20. No definite cause ascertained.

These notes are kindly submitted for this return by the Nurse Matron of the Hospital.

The Ante-natal Clinic was carried on during the year. The Resident Surgeon records that "the work is progressing satisfactorily and the benefit derived considerable. 91 patients attended, the number would have been greater had it not been for the Typhoid Epidemic which caused a suspension for about 3 months. The patients are now returning in increasing numbers".

The total still-births for the Colony including the Southern Grenadines was 119, 9 more than in 1930. "Apart from the ravages of disease as shewn by the Hospital returns of macerated babies there still continues sufficient evidence to guarantee the assertion that the type of attendance practised by the "grannics"

in the Colony is far from satisfactory".

Of 25 deaths from Tetanus, 21 occurred in the newly born, 4 in No. 2 District (North), 8 in No. 3 District, 2 in No. 4 District, and 7 in No. 5 District.

I have addressed a circular to the District Medical Officers on this subject inviting their views and recommendations in the hope of stamping out or reducing this type of infant mortality.

VI. Hospitals and Dispensaries.

The statistical returns of the work performed during the year are appended. At the Colonial Hospital the male and female blocks were painted and various minor repairs and improvements executed. The whole institution was supplied with electric lighting from the town mains. A garage was built for the new ambulance and a room for the Chanffeur added.

The new Motor Ambulance of the Federal type was purchased by the Government to replace the Ford, a gift by an esteemed citizen, Mr. Haywood. A chauffeur-mechanic who also does duty as an attendant warder for venereal cases

in the male wards was appointed.

The first call for duty was on March 16th. To the end of the year it had made 196 trips, a distance of 2,183 miles and brought 308 patients to Hespital at a cost of £35. 7. 8 exclusive of the wages of the chanffeur.

Its services were most valuable during the Typhoid Epidemic. The driver has proved himself careful and efficient. The Ambulance is in good running

With the assistance of Colonial Development Funds a Dispensary was built on Government lands adjoining the Police Station at Colonarie. This is a great improvement on the pre-existing accommodation and a distinct asset to District.

4. This Dispensary is well equipped and stocked with drugs. A similar building is being creeted at Troumaca in District 2 (North). This subsidiary dispensary will be equipped and stocked with drugs and brought into general use early in 1932.

A subsidiary dispensary was provided in the Police Station at Nesopotamia

in District 3, and brought into use in January 1931.

These subsidiary dispensaries are of great assistance to the labouring population of the different districts and saves time and labour in getting the prescriptions compounded. It is probable that in consequence of such additional dispensaries that more people attend to see the doctors and certainly more medicines are issued and used.

The Medical Officer of Carriacou paid 23 visits to Union Island, 9 to Mayreau and 8 to Canouan, he writes, "the present existing means of transportation to the Grenadines is uncertain. Too much time is wasted on the voyage to and from the Islets by the slow sailing eraft which is occasionally put at his disposal if she happens to be in the Grenadines on the day arranged for visiting".

The Medical Officer No. 1 District, St. Vincent, paid 26 visits to Bequia. The Resident Dispensers at Sandy Bay, Bequia and Union Island rendered first aid and attended respectively 970, 577, and 200 cases, a total of 1,747.

VII. Prisons and Asylums.

(a) Prisons.
